Remember that the quality of the defenses, hence the quality of the of the school on the labor market depends on you. The remote defences during the Covid crisis allows more flexibility so you can progress into your curriculum, but also brings more risks of cheat, injustice, laziness, that will harm everyone's skills development. We do count on your maturity and wisdom during these remote defenses for the benefits of the entire community.

# SCALE FOR PROJECT FT\_CONTAINERS (/PROJECTS/FT\_CONTAINERS)

You should evaluate 1 student in this team

### **Introduction**

- Only grade the work that is in the student or group's GiT repository.
- Double-check that the GiT repository belongs to the student or the group. Ensure that the work is for the relevant project and also check that "git clone" is used in an empty folder.
- Check carefully that no malicious aliases were used to fool you and make you evaluate something other than the content of the official repository.
- To avoid any surprises, carefully check that both the evaluating and the evaluated students have reviewed the possible scripts used to facilitate the grading.
- If the evaluating student has not completed that particular project yet, it is mandatory for this student to read the entire subject prior to starting the defense.
- Use the flags available on this scale to signal an empty repository, non-functioning program, a norm error, cheating etc. In these cases, the grading is over and the final grade is 0 (or -42 in case of cheating). However, except for cheating, you are

encouraged to continue to discuss your work (even if you have not finished it) to identify any issues that may have caused this failure and avoid repeating the same mistake in the future.

- Remember that for the duration of the defense, no segfault, no other unexpected, premature, uncontrolled or unexpected termination of the program, else the final grade is 0. Use the appropriate flag.

You should never have to edit any file except the configuration file if it exists. If you want to edit a file, take the time to explicit the reasons with the evaluated student and make sure both of you are okay with this.

- You must also verify the absence of memory leaks. Any memory allocated on the heap must be properly freed before the end of execution.

You are allowed to use any of the different tools available on the computer, such as leaks, valgrind, or e\_fence. In case of memory leaks, tick the appropriate flag.

#### **Disclaimer**

Please respect the following rules:

- Remain polite, courteous, respectful and constructive throughout the evaluation process. The well-being of the community depends on it.
- Identify with the person (or the group) evaluated the eventual dysfunctions of the work. Take the time to discuss and debate the problems you have identified.
- You must consider that there might be some difference in how your peers might have understood the project's instructions and the scope of its functionalities. Always keep an open mind and grade him/her as honestly as possible. The pedagogy is valid only and only if peer-evaluation is conducted seriously.

## **Guidelines**

You must compile with clang++, with -Wall -Wextra -Werror As a reminder, this project is in C++98.

C++11 (and later) members functions or containers are NOT expected.

Any of these means you must not grade the exercise in question:

- A function is implemented in a header (except in a template)
- A Makefile compiles without flags and/or with something other than clang++

Any of these means that you must flag the project as Forbidden Function:

- Use of a "C" function (\*alloc, \*printf, free)
- Use of a function not allowed in the subject

- Use of "using namespace" or "friend" (in this subject, "friend" is allowed - Use of an external library, or C++20 features	·
- Use of an already existing container, or any existing function, to implem	ent another container

Containers check	
Verify that each container is correctly implemented.	
Vector basics	
Make sure that each member function, overload and iterator are present of Use the standard library container to check that everything works the same	·
⊗ Yes	imesNo
Vector Advance	
The inner data structure should be a dynamic array.  const_iterator and iterators should be comparable.  Check the dynamic reallocation system.	
Test the swap function.  All iterators, pointers and references referring to elements in both containe and are now referring to the same elements they referred to before the cabut in the other container, where they now iterate.  Check that friend keyword is used only for operators.	·
	imesNo
Vector Performance	
Make sure that the speed is reasonable compared to the STL vector! For example, a deep copy should allocate all the memory in one call.	
	imesNo
Map Basics	
Make sure that each member function, overload and non-member overlo Use the standard library container to check that everything works the sam	

Map Advance		
Check the inner structu	re should be an ordered tree (AVL tree	e, R-B tree)
Check that pair<> is re	coded and used.	
ft::make_pair worked o	as intended.	
There are never two of	the same Key in one map.	
Check that the containe	er is ordered.	
Check std::allocator ar	nd allocator::rebind are used and ther	re's no direct usage of new.
Check that insert or de	lete do not invalidate iterators.	
Swap function should r	not move data but only pointers.	
Friend keyword should	only be used for operator overload.	
There's no memory lea	Κ.	
	∀es	XNo
	5 1 <b>60</b>	, <b>.</b>
Map Performance		
Make sure that the spe	ed is reasonable compared to the STI	LI
Slower than the STL is o	ok.	
A complete timeout is r	iot.	
If it's more than x20 slc	ower than the STL you should count fa	lse.
	<b>⊘</b> Yes	imesNo

	ember function, overload and non-m ry container to check that everything v	ember overload are present and work as expected. works the same way.
	⊗ Yes	imesNo
Stack Advance		
	classes vector, deaue and list are co	mpatible as underlyina container
The standard container	classes vector, deque and list are co	mpatible as underlying container.
The standard container The stack cannot be ite		
The stack cannot be ite	rate.	

 $\times$ No

#### Bonus

If and only if the mandatory part is complete, you can go on and grade the bonus containers asked in the subject.

#### Set

Make sure that each member function, overload and non-member overload are present and work as expected.

Use the standard library container to check that everything works the same way.

The inner data structure must be a Black and Red tree.

Ask the student details.

How it works? if you have any doubt don't count this bonus a std::set is easier than a map.

The only bonus here is for Red and Black tree!
